

**Determinants and Matrices**

1. The rank of a matrix A is said to be r if A satisfies the following conditions.

- i) There exists an r x r sub-matrix whose determinant is not zero.
- ii) The determinant of every (r+1) x (r+1) submatrix is zero.

2. Minor of a matrix A is the determinant formed by the elements of the matrix left after striking out certain rows and columns.

3. Consider the system of equations.

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ &\vdots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n &= b_m \end{aligned}$$

$$\text{Let } A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$$

$$[A, B] = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} & b_1 \\ a_{21} & a_{22} & \dots & a_{2n} & b_2 \\ \dots & \dots & \dots & \dots & \dots \\ a_{m1} & a_{m2} & \dots & a_{mn} & b_m \end{bmatrix}$$

Let the rank of A be R(A) and rank of [A, B] be R [A, B].

- i) The system AX = B is consistent if and only if R (A) = R (A, B)
- ii) If R(A) = R (A, B) = n (the number of unknowns), then the given system of equations is consistent and have unique solutions.
- iii) If R(A) = R(A, B) < n then the given system of linear equations is consistent and have infinite number of solutions.
- iv) If R(A) ≠ R(A, B), then the given system is not consistent (inconsistent) and have no solutions.

4. Consider the system of equations :

$$\begin{aligned} a_{11}x + a_{12}y + a_{13}z &= b_1 \\ a_{21}x + a_{22}y + a_{23}z &= b_2 \end{aligned}$$

$$a_{31}x + a_{32}y + a_{33}z = b_3$$

$$\text{Let } \Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

$$\Delta_x = \begin{vmatrix} b_1 & a_{12} & a_{13} \\ b_2 & a_{22} & a_{23} \\ b_3 & a_{32} & a_{33} \end{vmatrix}$$

$$\Delta_y = \begin{vmatrix} a_{11} & b_1 & a_{13} \\ a_{21} & b_2 & a_{23} \\ a_{31} & b_3 & a_{33} \end{vmatrix}$$

$$\Delta_z = \begin{vmatrix} a_{11} & a_{12} & b_1 \\ a_{21} & a_{22} & b_2 \\ a_{31} & a_{32} & b_3 \end{vmatrix}$$

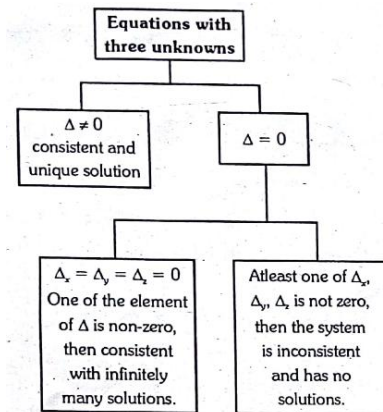

i) If  $\Delta \neq 0$ , the system is consistent and has unique solution.

Solutions are:

$$x = \frac{\Delta_x}{\Delta}, y = \frac{\Delta_y}{\Delta}, z = \frac{\Delta_z}{\Delta}$$

ii) If  $\Delta = 0$  and atleast one of the values of  $\Delta_x, \Delta_y, \Delta_z$  is non-zero then the system has no solution.

iii) If  $\Delta = 0, \Delta_x = \Delta_y = \Delta_z = 0$  and atleast one of the (2x2) minor of  $\Delta$  is non-zero or atleast one of the element of  $\Delta$  is non-zero, then the system is consistent and has infinitely many solutions.

**5. Homogeneous system of linear equations :**

A system of homogeneous linear equations are as follows:

$$a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = 0$$

$$a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = 0$$

⋮

$$a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_2$$

$$\text{Let } A = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & & & a_{2n} \\ \vdots & & & \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{bmatrix}$$

$$[A, B] = \begin{bmatrix} a_{11} & a_{12} & \dots & a_{1n} & 0 \\ a_{21} & & & a_{2n} & 0 \\ \vdots & & & & \\ a_{m1} & a_{m2} & \dots & a_{mn} & 0 \end{bmatrix}$$

Clearly, rank of A = rank of the augmented matrix [A, B].

i) The system of homogeneous equations is always consistent and obviously  $x_1 = x_2 = \dots = x_n = 0$  is a trivial solution.

ii) If rank (A, B) = rank A = n (the number of unknowns) then the trivial solution is the unique solution.

iii) If rank (A, B) = rank A < n then the system has non-trivial solution. In this case  $|A| = 0$

Consider the following system of homogeneous equations.

$$a_{11}x + a_{12}y + a_{13}z = 0$$

$$a_{21}x + a_{22}y + a_{23}z = 0$$

$$a_{31}x + a_{32}y + a_{33}z = 0$$

$$\text{Let } \Delta = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

**6. Eigen values and Eigen vectors :**

For  $n \times n$  square matrix A the equation  $|A - \lambda I| = 0$  is said to be the characteristic equation. The n roots of  $|A - \lambda I| = 0$  are called eigen values (characteristic roots, proper values(or) latent roots). Suppose  $\lambda_1, \lambda_2, \dots, \lambda_n$  be the eigen values of A, corresponding to each value of  $\lambda_r$  the equation  $AX = \lambda_r X$  has a non-zero solution vector  $X_r$ . It is said to be eigen vector of A corresponding to  $\lambda_r$ .

**Properties of Eigen values:**

i) Sum of eigen values is equal to the sum of the main diagonal elements of A (sum of eigen values = Trace of A)

ii) Product of eigen values of A =  $|A|$  (determinant of A)

iii) Every square matrix and its transpose have the same eigen values.

iv) If  $\lambda_1, \lambda_2, \dots, \lambda_n$  are eigen values of A. Then,

a)  $A^{-1}$  has eigen values  $\frac{1}{\lambda_1}, \frac{1}{\lambda_2}, \dots, \frac{1}{\lambda_n}$

b)  $A \pm kI$  has eigen values  $\lambda_1 \pm k, \lambda_2 \pm k, \dots, \lambda_n \pm k$

c)  $A^2$  has eigen values as  $\lambda_1^2, \lambda_2^2, \dots, \lambda_n^2$

d)  $A^m$  has eigen values  $\lambda_1^m, \lambda_2^m, \dots, \lambda_n^m$

e)  $kA$  has eigen values as  $k\lambda_1, k\lambda_2, \dots, k\lambda_n$

f) The eigen values of a triangular (upper or lower) matrix are the main diagonal elements.

Example:

$$\text{Eigen values of } \begin{bmatrix} 2 & 4 & 5 \\ 0 & 7 & 8 \\ 0 & 0 & 1 \end{bmatrix} \text{ are } 2, 7 \text{ and } 1$$

$$\text{Eigen values of } \begin{bmatrix} 3 & 0 & 0 \\ 5 & 4 & 0 \\ 6 & 5 & 7 \end{bmatrix} \text{ are } 3, 4 \text{ and } 7$$

v) If  $\lambda$  is an eigen values of an orthogonal matrix, then  $\frac{1}{\lambda}$  is also its eigen value.

vi) The eigen values of a real symmetric matrix are real numbers.

vii) Eigen vectors corresponding to distinct eigen values of a real symmetric matrix are orthogonal.

viii) If a real symmetric matrix of order 2 has equal eigen values then the matrix is a scalar matrix.

ix) If  $\lambda_1, \lambda_2, \dots, \lambda_n$  be distinct eigen values of a matrix A, then the corresponding eigenvectors  $X_1, X_2, \dots, X_n$  form a linearly independent set.

x) Similar matrices:

A square matrix B of order n is called similar to a square matrix A of order n if  $B = S^{-1}AS$  for some non-singular matrix S of order n. Similar matrices have the same eigen values.

xi) Corresponding to a eigen values of A, there are different eigen roots of A. Corresponding to a eigen vector of a matrix, there exists only one eigen value.

### 7. Cayley - Hamilton Theorem :

Every square matrix satisfies its own characteristic equation.

$$\text{Let } A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

If A is a square matrix of order 3, then its characteristic equation is  $\lambda^3 - S_1\lambda^2 + S_2\lambda - S_3 = 0$

Where,

$S_1 =$  Sum of the main diagonal elements i.e.,  
 $S_1 = a_{11} + a_{22} + a_{33}$

$S_2 =$  Sum of the minors of the main diagonal elements.

$$= \begin{bmatrix} a_{22} & a_{23} \\ a_{32} & a_{33} \end{bmatrix} + \begin{bmatrix} a_{11} & a_{13} \\ a_{31} & a_{33} \end{bmatrix} + \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

$S_3 =$  Determinant of A = |A|

$$\text{If } A = \begin{bmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{bmatrix}$$

Then, characteristic equation is  $\lambda^2 - S_1\lambda + S_2 = 0$

Where,

$S_1 =$  Sum of the main diagonal elements  
 $= a_{11} + a_{22}$

$S_2 = |A|$  (determinant of A)

### Quadratic form:

A homogeneous polynomial of second degree in any number of variables is called a quadratic form.

Any quadratic form may be reduced to canonical form by means of a non-singular transformations.

Let  $Q = ax^2 + by^2 + cz^2 + hxy + fyz + gzx$  be a quadratic form.

The corresponding matrix is

$$\begin{bmatrix} \text{coeff. } x^2 & \frac{1}{2} \text{coeff. } xy & \frac{1}{2} \text{coeff. } xz \\ \frac{1}{2} \text{coeff. } xy & \text{coeff. } y^2 & \frac{1}{2} \text{coeff. } yz \\ \frac{1}{2} \text{coeff. } xz & \frac{1}{2} \text{coeff. } yz & \text{coeff. } z^2 \end{bmatrix}$$

$$= \begin{bmatrix} a & \frac{h}{2} & \frac{g}{2} \\ \frac{h}{2} & b & \frac{f}{2} \\ \frac{g}{2} & \frac{f}{2} & c \end{bmatrix}$$

Let  $X^{-1}AX$  be the quadratic form in n variables  $x_1, x_2, \dots, x_n$

Let rank A = r

The number of positive square terms is called the index of the quadratic form and is denoted by s.

$\therefore$  The number of non-positive terms (negative terms and zero terms) = r - s  
 The difference between the positive square terms and the non-positive terms is called the signature of the quadratic form.

∴ Signature = s — (r - s) = 2s - r

Let A = [a<sub>ij</sub>] be the matrix of the quadratic form.

Then,

$$D_1 = |a_{11}| = a_{11}$$

$$D_2 = \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix}$$

$$D_3 = \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix}$$

⋮

$$D_n = |A|$$

Nature	Eigen value method	Principal minor method	Rank method s- index r - rank n - order of the matrix
Positive definite	All are positive	D <sub>1</sub> , D <sub>2</sub> , ..... D <sub>n</sub> all are positive	r = n and s = n
Negative Definite	All are negative	D <sub>1</sub> , D <sub>3</sub> , D <sub>5</sub> .....are negative D <sub>2</sub> , D <sub>4</sub> , D <sub>6</sub> .....are positive i.e., (-1) <sup>n</sup> D <sub>n</sub> > 0	r = n and s = 0
Positive semi definite	All are positive and atleast one is zero	All are positive and atleast one D <sub>i</sub> = 0	r < n and s = r
Negative semi definite	All are negative and atleast one is zero	D <sub>1</sub> , D <sub>3</sub> , ..... are negative D <sub>2</sub> , D <sub>4</sub> .....are positive atleast one is zero (or) (-1) <sup>n</sup> D <sub>n</sub> ≥ 0	r < n and s = 0
Indefinite	Both positive and negative	Both positive and negative	All other cases
