**SIMPLE AND COMPOUND INTEREST**

**INTEREST**

Interest is the fixed amount paid on borrowed money.
The sum lent is called the **Principal**.
The sum of the principal and interest is called the **Amount**.
Interest is of two kinds:
(i) **Simple interest**
(ii) **Compound interest**

(i) **Simple interest**: When interest is calculated on the original principal for any length of time, it is called simple interest.

- Simple interest = \( \frac{\text{Principal} \times \text{Time} \times \text{Rate}}{100} \)
- Amount = Principal + Interest
- Principal = \( \frac{100 \times \text{Simple Interest}}{\text{Rate} \times \text{Time}} \)
- Rate = \( \frac{100 \times \text{Simple Interest}}{\text{Principal} \times \text{Time}} \)
- Time = \( \frac{100 \times \text{Simple Interest}}{\text{Principal} \times \text{Rate}} \)
- If rate of simple interest differs from year to year, then
  \[ \text{S.I.} = \text{P} \times \frac{R_1}{100} + \text{P} \times \frac{R_2}{100} + \text{P} \times \frac{R_3}{100} + \cdots \]

**Example 1:**
Find the amount to be paid back on a loan of `18,000 at 5.5% per annum for 3 years.

**Solution:**
\[ \text{P} = 18000, \text{R} = 5.5\%, \text{T} = 3 \text{ years} \]
\[ \text{S.I.} = \frac{\text{P} \times \text{R} \times \text{T}}{100} = \frac{18000 \times 5.5 \times 3}{100} = \text{Rs.}2970 \]
\[ \text{Amount} = \text{P} + \text{I} = 18000 + 2970 = \text{Rs.}20970 \]

**Example 2:**
In how many years will a sum of money triple itself, at 25% per annum simple interest.

**Solution:**
Let the sum of money be `P. So, \( A = 3P \)
\[ \text{S.I.} = \text{A} - \text{P} = 3\text{P} - \text{P} = 2\text{P} \]
\[ \text{R}=25\% \]
\[ \therefore \text{T} = \frac{100 \times \text{S.I.}}{\text{P} \times \text{R}} = \frac{100 \times 2\text{P}}{\text{P} \times 25} = 8 \text{ years} \]

**Example 3:**
What rate per cent annum will produce `250 as simple interest on `6000 in 2.5 years.

**Solution:**
\[ \text{P} = 6000; \text{Time (T)} = 2.5 \text{ years}; \text{S.I.} = 250 \]
\[ \because \text{Rate} = \frac{\text{S.I.} \times 100}{\text{P} \times \text{T}} = \frac{250 \times 100}{6000 \times 2.5} = \frac{10}{6} = \frac{5}{3} = 1 \frac{2}{3} \% \]

**Example 4:**
To buy furniture for a new apartment, Sylvia Chang borrowed `5000 at 11% simple interest for 11 months. How much interest will she pay?

**Solution:**
From the formula, \( I = \text{Prt} \), with \( \text{P} = 5000, \text{r} = 0.11, \text{and t} = 11/12 \text{ (in years)} \). The total interest she will pay is
\[ \text{I} = 5000 \times (0.11) \times (11/12) = 504.17 \]
Or `504.17

(ii) **Compound interest**: Money is said to be lent at compound interest when at the end of a year or other fixed period, the interest that has become due is not paid to the lender, but is added to the sum lent, and the amount thus obtained becomes the principal in the next year or period. The process is repeated until the amount for the last period has been found. Hence, when the interest charged after a certain specified time period is added to form new principal for the next time period, the interest is said to be compounded and the total interest accrued is compound interest.

- C.I. = \( p\left[\left(1 + \frac{r}{100}\right)^n - 1\right] \)
- \( \text{Amount} = \text{P}\left(1 + \frac{r}{100}\right)^n \)
  Where \( n \) is number of time period.
Simple & Compound Interest Study Material

If rate of compound interest differs from year to year, then

\[ \text{Amount} = P \left(1 + \frac{r_1}{100}\right) \left(1 + \frac{r_2}{100}\right) \left(1 + \frac{r_3}{100}\right) \ldots.. \]

Example 5:
If `60000 amounts to `68694 in 2 years then find the rate of interest.

Solution:
Given: \( A = `68694 \)
\( P = `60000 \)
\( n = 2 \) years
\( r = ? \)

\[ \frac{A}{P} = \left(1 + \frac{r}{100}\right)^n \]
\[ \frac{68694}{60000} = \left(1 + \frac{r}{100}\right)^2 \]
\[ \frac{11449}{10000} = \left(1 + \frac{r}{100}\right)^2 \]
\[ 1 + \frac{r}{100} = \sqrt{1.1449} = 1.07 \]
\[ \frac{r}{100} = 0.07 \times 100 = 7\% \]

Example 6:
In how many years, the sum of `10000 will become `10920.25 if the rate of compound interest is 4.5% per annum?

Solution:
\( A = `10920.25 \)
\( P = `10000 \)
Rate of interest = 4.5%
Time \( (n) = ? \)

\[ A = P \left(1 + \frac{r}{100}\right)^n \]
\[ 10920.25 = 10000 \left(1 + \frac{4.5}{100}\right)^n \]

\[ \frac{10920.25}{10000} = \left(1 + \frac{0.9}{20}\right)^n = \left(\frac{20.9}{20}\right)^n = 436.81/400 \]
\[ \left(\frac{20.9}{20}\right)^n = \left(\frac{20.9}{20}\right)^n \]

Hence `10000 will become `10920.25 in 2 years at 4.5%.

Example 7:
Find the compound interest on `8000 at 15% per annum for 2 year 4 months, compound annually.

Solution:
Time = 2 years 4 months = \( 2\frac{1}{3} \) years
Amount = `11109

\[ \text{C.I.} = (11109 - 8000) = `3109 \]

\[ A = P \left(1 + \frac{r}{2 \times 100}\right)^{2n} \]

Example 8:
What will be the compound interest on `4000 in 4 years at 8 per cent annum. If the interest is calculated half-yearly.

Solution:
Given: \( P = Rs.4000, r = 8\% , n = 4\) years
Since interest is calculated half-yearly, therefore,
\[ r = \frac{8}{2} \times 100 = 4\% \text{ and } n = 4 \times 2 = 8 \text{ half years} \]
Simple & Compound Interest Study Material

\[ A = 4000 \left(1 + \frac{4}{100}\right)^8 = 4000 \times \left(\frac{26}{25}\right)^8 \]
\[ = 4000 \times 1.3685 = 5474.2762 \]

Amount = `5474.28

\[ \therefore \text{Interest} = \text{Amount} - \text{Principal} \]
\[ = \text{`5474.28} - \text{`4000} = \text{`1474.28} \]

\[ \text{Example 9:} \]

Find the compound interest on `25625 for 12 months at 16% per annum, compound quarterly.

\[ \text{Solution:} \]

Principal (P) = `25625

Rate (r) = 16\% = \frac{16}{4}\% = 4\%

Time = 12 months = 4 quarters

\[ A = 25625 \left(1 + \frac{4}{100}\right)^4 = 25625 \left(\frac{26}{25}\right)^4 \]
\[ 25625 \times \frac{26}{25} \times \frac{26}{25} \times \frac{26}{25} \times \frac{26}{25} = \text{`29977.62} \]

C.I. = A - P = 29977.62 - 25625 = `4352.62

\[ \text{Example 10:} \]

The difference between compound interest and simple interest on a certain amount of money at 5% per annum for 2 years is `1.5. Find the sum:

(a) `4500  
(b) `7500  
(c) `5000  
(d) `6000

\[ \text{Solution:} \]

(d) Let the sum be `100.

Therefore, S.I. = \frac{100 \times 5 \times 2}{100} = `10

and C.I. = 100 \left(1 + \frac{5}{100}\right)^2 - 100

= 100 \times \frac{21 \times 21}{20 \times 20} - 100 = \frac{41}{4}

Difference of C.I and S.I = \frac{41}{4} - \frac{10}{4} = \frac{1}{4}

If the difference is \frac{1}{4}, the sum = 100

\[ \Rightarrow \text{If the difference is `15, the sum} \]
\[ = 400 \times 15 = \text{Rs.6000} \]

\[ \text{POPULATION FORMULA} \]

The original population of a town is P and the annual increase is R\%, then the population in years is \[ P \left(1 + \frac{R}{100}\right)^n \] and if the annual decrease is R\%, then the population in a year is given by a change of sign in the formula i.e \[ P \left(1 - \frac{R}{100}\right)^n \]

\[ \text{Example 11:} \]

If the annual increase in the population of a town is 4% and the present population is 15625 what will be the population in 3 years.

\[ \text{Solution:} \]

\[ 15625 \left(1 + \frac{4}{100}\right)^3 \]

Required population: 15625(1.04)^3 = 17576

\[ \text{NOTE:} \]
A certain sum is lent out on a certain rate of interest for a certain period. Again the same sum is out on $x\%$ higher rate of interest for $y\%$ higher period. Then the $\%$ increase in S.I is given by $\left(x + y + \frac{xy}{100}\right)\%$

P is lent out at the rate of $R_1\%$ and $P_2$ is lent out at the rate of $R_2\%$. Then over all rate of interest will be

$$R = \frac{P_1R_1 + P_2R_2}{P_1 + P_2}$$

$\frac{1}{x_1}$ part of the principal is lent out on $R_1\%$ rate of interest,

$\frac{1}{x_2}$ part of the principal is lent out on $R_2\%$ rate of interest. . . . . .

$\frac{1}{x_n}$ part on $R_n\%$ rate of interest. The over all rate of interest on whole sum is equal to

$$\left(\frac{1}{x_1} \times R_1 + \frac{1}{x_2} \times R_2 + \cdots + \frac{1}{x_n} \times R_n\right)$$

**EFFECTIVE RATE**

If $\$1$ is deposited at 4% compounded quarter, a calculator can be used to find that at the end of one year, the compound amount is $\$1.0406$, an increase of 4.06% over the original $\$1$. The actual in the money is somewhat higher than the stated increase of 4%. To differentiate between these two numbers, 4% is called the nominal or stated rate of interest, while 4.06% is called the effective rate. To avoid confusion between stated rates and effective rates, we shall continue to use $r$ for the stated rate and we will use $r_e$ for the effective rate.

**Example 12:**

Find the effective rate corresponding to a stated rate of 6% compound semiannually.

**Solution:**

A calculator shows that $\$100$ at 6% compounded semiannually will grow to $A=100\left(1 + \frac{.06}{2}\right)^2 = 100(1.03)^2 = $106.09

Thus, the actual amount of compound interest is $\$106.09 - \$100=\$6.09$. Now if you earn $.06$ interest on $\$100 in 1 year with annual compounding, your rate is $6.09/100=.0609=6.09\%$

Thus, the effective rate is $r_e = 6.09\%$

**Example 14:**

A bank pays interest of 4.9% compounded monthly. Find the effective rate.

**Solution:**

Use the formula given above with $r=.049$ and $m=12$.

The effective rate is $r_e = \left(1 + \frac{.049}{12}\right)^{12} - 1 = 1.05011575-1=.0501$ or 5.01%

- Present worth of $\$p$ due $n$ years hence

Present worth=$\frac{p}{\left(1+\frac{r}{100}\right)^n}$

- Equal annual instalement to pay the borrowed amount

Let the value of each instalment = $\$x$

Rate = $r\%$ and time = $n$ years

Then, Borrowed Amount

$$= x \left(\frac{1}{\left(1+\frac{r}{100}\right)^1}\right) + \frac{x}{\left(1+\frac{r}{100}\right)^2} + \cdots + \frac{x}{\left(1+\frac{r}{100}\right)^n}$$

**Example 13:**

A bank pays interest of 4.9% compounded monthly. Find the effective rate.
Subash purchased a refrigerator on the terms that he is required to pay `1,500 cash down payment followed by `1,020 at the end of first year, `1,003 at the end of second year and `990 at the end of third year. Interest is charged at the rate of 10% per annum. Calculate the cash price:

**Solution:**

Cash down payment = `1500  
Let `x becomes `1020 at the end of first year.  
Then, 1020 = x + 10/100  
or x = \frac{1020 \times 100}{110} = `927.27  
Similarly, 1003 = \left(1 + \frac{10}{100}\right)^2  
or y = \frac{1003 \times 20 \times 22}{22 \times 22} = `828.92  
and z = \frac{990 \times 20 \times 22}{22 \times 22 \times 22} = `743.80  
Hence, CP = 1500+927.27+828.92+743.80 = `3999.99 or `4000

**Example 15:**
The difference between the interest received from two different banks on `500 for 2 yrs is `2.5. Find the difference between their rates.

**Solution:**

I_1 = \frac{500 \times 2 \times r_1}{100} = 10r_1  
I_2 = \frac{500 \times 2 \times r_2}{100} = 10r_2  
I_1 - I_2 = 10r_1 - 10r_2 = 2.5  
Or, r_1 - r_2 = \frac{2.5}{10} = 0.25%

**Short-cut method:**  
When t_1 = t_2,  
(r_1 - r_2) = \frac{I_1 \times 100}{\text{sum} \times t} = \frac{2.5 \times 100}{500 \times 2} = 0.25%

**Example 16:**
At what rate per cent compound interest does a sum of money becomes nine-fold in 2 years?

**Solution:**
Let the sum be `x and the of compound interest be r% per annum; then  
9x = x \left(1 + \frac{r}{100}\right)^2  
or 9 = \left(1 + \frac{r}{100}\right)^2  
Or, 3 = 1 + \frac{r}{100}, \text{ or } \frac{r}{100} = 2 \therefore r = 200%

**Short-cut method:**
The general formula of compound interest can be changed to the following form:  
If a certain sum becomes `m` times, the rate of compound interest is equal to \(100\left[(m)^{1/t} - 1\right]\).  
In this case, r = 100\left[(3)^{1/2} - 1\right]  
=100(3-1) = 200%

**Example 17:**
The simple interest on a certain sum of money at 4% per annum for 4 yrs is `80 more than the interest on the same sum for 3 yrs at 5% per annum. Find the sum.

**Solution**

Let the sum be `x, then at 4% rate for 4 yrs the simple interest  
\(\frac{x \times 4 \times 4}{100} = \frac{4x}{25}\)  
At 5% rate for 3 yrs the simple interest  
\(\frac{x \times 5 \times 3}{100} = \frac{3x}{20}\)  
Now, we have \(\frac{4x}{25} - \frac{3x}{20} = 80\)  
\(\therefore \ x = `8000\)

**Alternate Method:**
For this type of question sum  
\(\text{Sum}=\text{difference} \times \frac{100}{r_2 t_1 = r_2 t_2}\)  
\(\frac{80 \times 100}{4 \times 4 - 3 \times 5} = `8000\)

**Example 18:**
Some amount out of `7000 was lent at 6% per annum and the remaining at 4% per annum. If the total simple interest from both the fractions in 5 yrs was `1600, find the sum lent at 6% per annum.

**Solution:**

Suppose `x was lent at 6% per annum.
Thus, \[
\frac{x \times 6 \times 5}{100} + \frac{(7000-x) \times 4 \times 5}{100} = 1600
\]
Or, \[
\frac{3x}{10} + \frac{7000-x}{5} = 1600
\]
Or, \[3x + 14000 - 2x = 16000\]
\[\therefore x = 16000 - 14000 = Rs.2000\]

**By Method of Alligation:**
Overall rate of interest
\[
\frac{1600 - 100}{5 \times 7000} = \frac{32}{7}\%
\]

\[\therefore\] ratio of two amounts = 2:5
\[\therefore\] amount lent at 6\% = \[
\frac{7000}{7} \times 2 = \`2000
\]

**Example 19:**
As n amount of money grows upto \`4840 in 2 yrs and upto \`5324 in 3 yrs on compound interest. Find the rate percent

**Solution:**
We have,
P+CI of 3 yrs = \`5324......(i)
P+CI of 2 yrs = \`4840......(ii)
Subtracting (ii) from (i), we get
CI of 3\(^{rd}\) year = 5324-4840 = \`484.

Thus, the CI calculated in the third year which is \`484 is basically the amount of interest on the amount generated after 2 years which is \`4840.

**Alternate method:**
Difference of amount after \(n\) yrs and \((n + 1)\) yrs \times 100

\[
\text{Amount after } n \text{ yrs}
\]
\[
\text{In this, } n=2.
\]
\[\therefore\] rate = \[
\frac{\text{Difference of amount after 2 yrs and 3 yrs } \times 100}{\text{Amount after 2 yrs}}
\]
\[
\frac{(5324 - 4840)}{4840} \times 100 = \frac{484 \times 100}{4840} = 10\%
\]

**Example 20:**
Find the compound interest on \`18,750 in 2 yrs the rate of interest being 4\% for the first year and 8\% for the second year.

**Solution:**
After first year the amount
\[
= 18750\left(1 + \frac{4}{100}\right) = 18750\left(\frac{104}{100}\right)
\]
After 2\(^{nd}\) year the amount = 18750\left(\frac{104}{100}\right)\left(\frac{108}{100}\right)
\[
= 18750\left(\frac{26}{25}\right)\left(\frac{27}{25}\right) = 21060
\]
\[\therefore\] CI = 21060-18,750 = \`2310.
